

What if people don't need more information - they need different capability?

A 90-minute certification was teaching people facts they could look up, while skipping the things they actually needed to understand.

- Learning and Capability Expertise
- Executive-Level Scope
- Business Results

The questions coming to me weren't difficult.

Listening sessions

Seller-call notes

Live call observations

Point of contact for WFS questions

In every environment, I kept seeing associates escalated what I called Tier 1 questions. The answers already existed - no interpretation required, and no specialized system access. But when I tried finding those answers myself in real time, I discovered another problem - our knowledge systems were hard to search.

We had two different problems. And two solutions.

PROBLEM 1: CAN'T FIND IT

SOLUTION 1
The SharePoint experience was an afterthought, with materials and pages added as needed, rather than designed holistically. It had to be restructured.

PROBLEM 2: DON'T KNOW HOW TO USE IT

SOLUTION 2
The 90-minute certification focused on details like dimensional thresholds - information associates could simply look up. It didn't adequately teach:

- ✓ Why WFS?
- ✓ How does fulfillment work?
- ✓ What should I actually be able to do in my role?

It had to be rebuilt.

All of which was compounded by multiple employee groups who interacted with WFS in different ways.

So I created a capability journey that supported all Walmart Marketplace associates.

And I built it myself.

Then I needed the organization to take it en masse.

I presented what we'd heard from associates, connecting the solution directly to the problems the VP's organization had raised and made a specific ask - **make it mandatory**. He agreed.

With an 85% completion rate across his organization, they exceeded their WFS acquisition goal for the first time - reaching 116% of target.

AT A GLANCE

- 

5 capability levels
- 

Multiple seller-facing roles
- 

VP sponsored required completion
- 

116% performance achievement

WHY THIS STORY

I care more about what people can do than what they've completed. This is where that belief became an operating philosophy: start with the capability the business needs, then design backward from it.

This story also demonstrates:

- Needs assessment
- Performance alignment
- Executive influence
- Change leadership
- Learning design

IF WE TALK, ASK ME ABOUT

- > How I realized the "easy questions" were actually a systems problem.
- > What I deliberately removed from the 90-minute course.
- > What leadership needed to hear before I asked for the mandate.
- > What 116% results does - and does not - prove.
- > The risk I took tying completion and performance to executive visibility.
- > Why I didn't fix the certification first.

WHAT I'M PROUD OF

In the absence of headcount support, I upskilled myself across several tools to provide not only an effective experience, but an engaging one.

MY GUIDING PRINCIPLE

Every learner at some point asks "What's in it for me?" and they shouldn't have to search for that in their resources. As experts, we should make it obvious.

IF I HAD A DO-OVER

I'd spend more time with the leaders after certification. What should they listen for? How should they coach? How do they recognize someone who completed the learning but isn't yet applying it? That's the reinforcement layer I'd build earlier.
